## Comorbidity

Is there a relationsh between childhood ADHD and later dru abuse? See page 2

from the director:

Comotolity is a topic that our stakeholders-public state of the health come professionals, and otherswhich was have instituted in the weak of the state of the science in information on the state of the science in information on the state of the science in the same. Although suspend and all state commonly uso occur with day allouas and controlly uso occur with day allouas and conditionally on occur with days the and the science of the and the science of the days of da

To help explain the cornectivity, we need to help explain the cornectivity we need to help explain the statement of the mental iteration. It is a complex help the statement of the original statement of the stat

It is often difficult to dissentingle the overlapping appropriate of drug address and other mental linesses, making and other mental linesses, making and addresses is contracted to the addresses is an other than the second of denote the address and effective treatment. Ignorance of an entry of particular distribution of the addresses and the addresses and the address and the addr

Nors D. Volkow; M.D. Director National Institute on Drug Abuse

#### Research Report Series

Comorbidity:

#### What Is Comorbidity?

hen two disorders or illnesses occur in the same person, simultaneously or sequentially, they are described as comorbid. Comorbidity also implies interactions between the illnesses that affect the course and prognosis of both.

continued inside

"Since the focus of this report is on comotivid drug use disorders and other menal illeasis menal illeasis" menal illeasis" menal illeasis" will refer here to disorders other then substance use disordens, such as depression, scholphreinia, anviety, and main. The terms "dual deposis," "mentally il chemical abuse;" and "co-occurrence" are also used to refer to drug use disorders that are comotived with other menal illeases.

U.S. Department of Health and Human Services | National Institutes of Health

Dr. Volkow, Director, NIDA: Comorbidity is a topic that our stakeholders-patients, family members, health care professionals, and others-frequently ask about. It is also a topic about which we have insufficient information, so it remains a research priority for NIDA.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

## An Example Trait Questionnaire

#### Fagerstrom Test for Nicotine Dependence

Quantitative Scale 1. How many cigarettes a day do you usually	smoke?					
1 to 10	0 point	21 to 30	2 points			
11 to 20	1 point	30 or more	3 points			
2. How soon after you wake up do you smoke	igarette?	Ordinal Scale				
After 60 minutes	0 point	6 - 30 minutes	2 points			
31-60 minutes	1 point	< 5 minutes	3 points			
3. Do you smoke more during the first two hours of the day than during the rest of the day?						
No	0 point	Yes	1 point			
4. Which cigarette would you most hate to give up?						
Any other cigarette than the first one	0 point	The first cigarette in the morning	1 point			
5. Do you find it difficult to refrain from smoking in places where it is forbidden, such as public buildings, on airplanes or at work?						
No Dichotomous Scale	0 point	Yes	1 point			
6. Do you still smoke even when you are so ill that you are in bed most of the day?						
No	0 point	Yes	1 point			
		Totalpoints	-

< ∃ >

- n study subjects, from a population-based study or family-based study
- For each subject:
  - A vector of traits  $\mathbf{T} = (T^{(1)}, \dots, T^{(p)})'$
  - Marker genotype M
  - Parental marker genotypes *M*<sup>*pa*</sup> (only available in a family-based study)
  - A vector of covariates  $\mathbf{Z} = (Z^{(1)}, \dots, Z^{(l)})'$
- Null hypothesis: no association between marker alleles and any linked locus that influences traits **T**, conditional on **Z**

- A nonparametric statistic measuring the rank correlation between two variables
- Pairs of observations:  $\{(X_i, Y_i) : i = 1, ..., n\}$
- $(X_i, Y_i)$  and  $(X_j, Y_j)$ :
  - Concordant, if  $X_i X_j$  and  $Y_i Y_j$  have the same sign
  - Disconcordant, if  $X_i X_j$  and  $Y_i Y_j$  have the different sign
- Kendall's tau:

$$\tau = 2(A - B) / \{n(n - 1)\}$$

A and B: numbers of concordant and disconcordant pairs

Or

$$\tau = {\binom{n}{2}}^{-1} \sum_{i < j} \operatorname{sign}\{(X_i - X_j)(Y_i - Y_j)\}$$

## Generalized Kendall's Tau

- $\mathbf{F}_{ij} = \{f_1(T_i^{(1)} T_j^{(1)}), \dots, f_p(T_i^{(p)} T_j^{(p)})\}'$ 
  - $f_k(\cdot)$ : identity function for a quantitative or binary trait
  - $f_k(\cdot)$ : sign function for an ordinal trait
- $D_{ij} = C_i C_j$ . C: number of any chosen allele in marker genotype M
- Genaralized Kendall's tau (Zhang, Liu and Wang, 2010):

$$\mathbf{U} = \binom{n}{2}^{-1} \sum_{i < j} D_{ij} \mathbf{F}_{ij}$$

- Special cases:
  - FBAT-GEE (Lange et al. 2003)
  - Test for a single ordinal trait (Wang, Ye and Zhang, 2006)

A > + = + + =

- A weight function w(Z<sub>i</sub>, Z<sub>j</sub>) imposes a relatively large weight when Z<sub>i</sub> is close to Z<sub>j</sub>, and a relatively small weight when Z<sub>i</sub> and Z<sub>j</sub> are far away
- Weighted U-statistic:

$$\mathbf{S} = \binom{n}{2}^{-1} \sum_{i < j} D_{ij} \mathbf{F}_{ij} w(\mathbf{Z}_i, \mathbf{Z}_j)$$

Weighted test statistic:

$$\chi_{\tau}^{2} = \{\mathbf{S} - E_{0}(\mathbf{S})\}^{\prime} \operatorname{Var}_{0}^{-1}(\mathbf{S})\{\mathbf{S} - E_{0}(\mathbf{S})\}$$

 Write Z = (Z<sup>co'</sup>, Z<sup>ca'</sup>)', with Z<sup>co</sup> for the continuous covariates and Z<sup>ca</sup> for the categorical covariates

$$w(\mathbf{Z}_i, \mathbf{Z}_j; h, q) = W_h(\|\mathbf{Z}_i^{co} - \mathbf{Z}_j^{co}\|) W_q\{I(\mathbf{Z}_i^{ca} \neq \mathbf{Z}_j^{ca})\}$$

• For example,

$$W_h(u) = \exp(-u^2/2h^2), \ h > 0,$$

$$W_q(v) = (1 - q)I(v = 0) + qI(v = 1), \ 0 \le q \le 0.5$$

• Weighted U-statistic (called fixed-(h, q) U-statistic):

$$\mathbf{S}(h,q) = {\binom{n}{2}}^{-1} \sum_{i < j} D_{ij} \mathbf{F}_{ij} w(\mathbf{Z}_i, \mathbf{Z}_j; h, q)$$

## Weight Function–II: Propensity Score

- Propensity score: probability of a unit being assigned to a particular treatment given a set of covariates
- Causal effect analysis: match subjects according to their propensity scores (Rosenbaum and Rubin, 1984)
- Genomic propensity score:  $p(\mathbf{z}) = \{p_1(\mathbf{z}), p_2(\mathbf{z})\}', p_c(\mathbf{z}) = P(C = c | \mathbf{Z} = \mathbf{z})$
- Genetic association analysis: match subjects according to their genomic propensity scores
- Weight function:

$$w(\mathbf{Z}_i, \mathbf{Z}_j) = W_h\{\|p(\mathbf{Z}_i) - p(\mathbf{Z}_j)\|\},\$$

with  $W_h(u) = \exp(-u^2/2h^2), h > 0$ 

## Asymptotic Distribution: Null Hypothesis

• When  $n \to \infty$ ,

$$\operatorname{Var}_{0}^{-1/2} \{ \mathbf{S}(h,q) \} [\mathbf{S}(h,q) - E_{0} \{ \mathbf{S}(h,q) \}] \stackrel{\mathcal{D}}{\longrightarrow} N(\mathbf{0},\mathbf{I}_{p})$$

• Fixed-(*h*, *q*) test statistic:

$$\chi^2_{\tau}(h,q) \stackrel{\mathcal{D}}{\longrightarrow} \chi^2_p$$

Mean and variance:

$$E_{0}\{\mathbf{S}(h,q)\} = \frac{2}{n-1} \sum_{i=1}^{n} \bar{\mathbf{u}}_{i} E_{0}(C_{i} | M_{i}^{pa}, \mathbf{Z}_{i}),$$
  

$$\operatorname{Var}_{0}\{\mathbf{S}(h,q)\} = \frac{4}{(n-1)^{2}} \sum_{i=1}^{n} \sum_{i=1}^{n} \bar{\mathbf{u}}_{i} \bar{\mathbf{u}}_{j}^{\prime} \operatorname{Cov}_{0}(C_{i}, C_{j} | M_{i}^{pa}, M_{j}^{pa}, \mathbf{Z}_{i}, \mathbf{Z}_{j}),$$

with 
$$\bar{\mathbf{u}}_i = n^{-1} \sum_{j=1}^n \mathbf{F}_{ij} w(\mathbf{Z}_i, \mathbf{Z}_j; h, q)$$

< □ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

• Under the alternative hypothesis,

$$\chi^2_\tau(h,q) \sim \sum_{i=1}^p e_i \chi^2_1(\phi_i)$$

•  $\Delta \boldsymbol{\mu} = \boldsymbol{\mu}_1 - \boldsymbol{\mu}_0 \equiv E_1 \{ \mathbf{S}(h,q) \} - E_0 \{ \mathbf{S}(h,q) \}$ 

• 
$$\Sigma_0 = \operatorname{Var}_0\{\mathbf{S}(h,q)\}$$
  
•  $\Sigma_1 = \operatorname{Var}_1\{\mathbf{S}(h,q)\}$ 

- $e_1 \ge \cdots \ge e_p \ge 0$ : eigenvalues of  $\Sigma_1^{1/2} \Sigma_0^{-1} \Sigma_1^{1/2}$ •  $\phi_i = \Delta \tilde{\mu}_i^2$
- $\Delta \tilde{\mu}_i$ : *i*th component of  $\Delta \tilde{\mu} = \mathbf{Q} \Sigma_1^{-1/2} \Delta \mu$
- **Q**: an orthonormal matrix,  $\mathbf{Q} \mathbf{\Sigma}_1^{1/2} \mathbf{\Sigma}_0^{-1} \mathbf{\Sigma}_1^{1/2} \mathbf{Q}' = \text{diag}(e_1, \dots, e_p)$

## Factors Determining the Power

- The conditional power  $\mathcal{P}$ :  $\mathcal{P} = P\left\{\sum_{i=1}^{p} e_i \chi_1^2(\phi_i) \ge q_{\chi_p^2}(1-\alpha)\right\}$
- Taking a family-based study as an example,

$$\mu_1 = \frac{2}{n-1} \sum_{i=1}^n \bar{\mathbf{u}}_i E(C_i | \mathbf{T}_i, \mathbf{Z}_i, M_i^{pa})$$
  
$$\Sigma_1 = \frac{4}{(n-1)^2} \sum_{i=1}^n \sum_{j=1}^n \bar{\mathbf{u}}_i \bar{\mathbf{u}}_j' \operatorname{Cov}(C_i, C_j | \mathbf{T}_i, \mathbf{T}_j, \mathbf{Z}_i, \mathbf{Z}_j, M_i^{pa}, M_j^{pa})$$

• By Bayes' theorem,  $P(C = c | \mathbf{T}, \mathbf{Z}, M^{pa}) = \frac{P(\mathbf{T} | C = c, \mathbf{Z}) P(C = c | M^{pa})}{\sum_{c'} P(\mathbf{T} | C = c', \mathbf{Z}) P(C = c' | M^{pa})}$ 

- Penetrance:  $P(\mathbf{T}|C = c, \mathbf{Z})$
- Allele frequency:  $P(C = c | M^{pa})$

#### Using the result from Liu et al. (2009), we have

#### Theorem

$$\mathcal{P} \approx P\{\chi_l^2(\nu) \ge q^*\},$$

where  $l, \nu$ , and  $q^*$  depend on  $\mu_1$  and  $\Sigma_1$ .

< ∃ ►

- Fixed-(*h*, *q*) test: how to choose optimal parameters *h* and *q*?
- Choose a grid of *h* and *q* values and maximize the weighted test statistic over those choices
- $\{h_1, \ldots, h_{L_1}\}$ : pre-specified grid points of h
- $\{q_1, \ldots, q_{L_2}\}$ : pre-specified grid points of q

$$\chi^2_{ au,\max} = \max_{1 \le l_1 \le L_1, 1 \le l_2 \le L_2} \chi^2_{ au}(h_{l_1},q_{l_2})$$

 Approximate the optimal weighting scheme, yielding the strongest association measure

#### An intuitive approach through computation...

- Population-based studies: restricted permutation in Yu et al. (2010)
- Family-based studies: children's genotypes solely determined by their parents' marker alleles, resample the children's genotype by Mendelian laws
- Calculate *M* resampling test statistics *χ*<sup>2</sup><sub>τ,max,1</sub>,..., *χ*<sup>2</sup><sub>τ,max,M</sub> using *M* resampled data
- Resampling p-value: the proportion of the resampling test statistics that exceed our observed test statistic, i.e.,
   M<sup>-1</sup> ∑<sup>M</sup><sub>m=1</sub> I(χ<sup>2</sup><sub>τ,max,m</sub> ≥ χ<sup>2</sup><sub>τ,max</sub>)
- U Computation too intensive!

## Asymptotic Distribution: Joint Distribution

#### An theoretical approach through approximation...

• Equivalently,  $\chi^2_{\tau,\max} = \max_{1 \leq l_1 \leq L_1, 1 \leq l_2 \leq L_2} \|\mathbf{R}_{l_1,l_2}\|^2$ 

• 
$$\mathbf{R} = \operatorname{Var}_{0D}^{-1/2}(\mathbf{S})\{\mathbf{S} - E_0(\mathbf{S})\}$$
  
•  $\mathbf{S} = \{\mathbf{S}'(h_1, q_1), \dots, \mathbf{S}'(h_{L_1}, q_{L_2})\}'$   
•  $\operatorname{Var}_{0D}(\mathbf{S}) = \operatorname{diag}[\operatorname{Var}_0\{\mathbf{S}(h_1, q_1)\}, \dots, \operatorname{Var}_0\{\mathbf{S}(h_{L_1}, q_{L_2})\}]$ : the diagon

•  $\operatorname{Var}_{0D}(\mathbf{S}) = \operatorname{diag}[\operatorname{Var}_0{\mathbf{S}(h_1, q_1)}, \dots, \operatorname{Var}_0{\mathbf{S}(h_{L_1}, q_{L_2})}]$ : the diagonal blocks of  $\operatorname{Var}_0(\mathbf{S})$ 

$$\operatorname{Var}_{0}^{-1/2}(\mathbf{S})\{\mathbf{S} - E_{0}(\mathbf{S})\} \xrightarrow{\mathcal{D}} N(\mathbf{0}, \mathbf{I}_{pL_{1}L_{2}})$$
  
•  $\tilde{\mathbf{R}} = \operatorname{Var}_{0D}^{-1/2}(\mathbf{S})\operatorname{Var}_{0}^{1/2}(\mathbf{S})\mathbf{G}, \mathbf{G} \sim N(\mathbf{0}, \mathbf{I}_{pL_{1}L_{2}})$ 

#### Theorem

Assume that the eigenvalues of  $\operatorname{Var}_{0D}(\mathbf{S})$  and  $\operatorname{Var}_0(\mathbf{S})$  are uniformly bounded from both above and below, i.e., there exist two positive numbers c and C such that  $c \leq \lambda_{\min} \{\operatorname{Var}_{0D}(\mathbf{S})\} \leq \lambda_{\max} \{\operatorname{Var}_{0D}(\mathbf{S})\} \leq C$ and  $c \leq \lambda_{\min} \{\operatorname{Var}_0(\mathbf{S})\} \leq \lambda_{\max} \{\operatorname{Var}_0(\mathbf{S})\} \leq C$  uniformly for all n, where  $\lambda_{\min}$  and  $\lambda_{\max}$  denote the smallest and largest eigenvalues respectively. Then for any  $x \in \mathbb{R}$ , as  $n \to \infty$ ,

$$\sup_{x\in\mathbb{R}} \left| P\Big(\chi^2_{\tau,\max} \le x\Big) - P\Big(\max_{1\le l_1\le L_1, 1\le l_2\le L_2} \|\tilde{\mathbf{R}}_{l_1,l_2}\|^2 \le x\Big) \right| \to 0.$$

< ∃ >

- Collected by Wellcome Trust Case-Control Consortium (WTCCC, 2007, Nature)
  - Phenotype: 1998 cases/3004 controls of bipolar disorder
  - Genotype: genotyped by Affymetrix GeneChip 500K arrays
  - Covariates: gender, age at recruitment
- Our method: weighted test using propensity score approach (h = 1)
- Methods for comparison: non-weighted test and logistic regression
- Strong association: p-value  $<5\times10^{-7};$  moderate association:  $5\times10^{-7}<$  p-value  $<10^{-5}$

## Manhattan Plot: Comparison of Three Methods

## Collaborative Studies on Genetics of Alcoholism

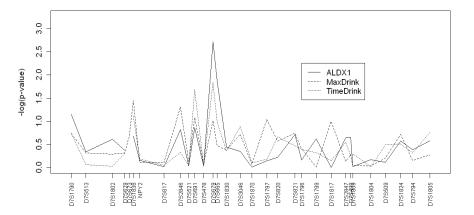

A large scale study to map alcohol dependence susceptible genes

Heping Zhang (C<sup>2</sup>S<sup>2</sup>, Yale University)

- The data include 143 families with a total of 1,614 individuals
- Multiple Traits:
  - ALDX1 (the severity of the alcohol dependence): pure unaffected, never drunk, unaffected with some symptoms, and affected
  - MaxDrink (maximum number of drinks in a 24 hour period): 0-9, 10-19, 20-29, and more than 30 drinks
  - TimeDrink (spent so much time drinking, had little time for anything else): "no", "yes and lasted less than a month", and "yes and lasted for one month or longer"
- Genotypes: markers on chromosome 7
- Covariates: age at interview and gender

### Results

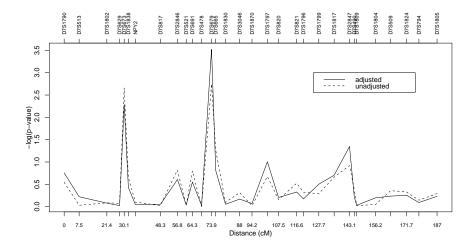

P-values between one of the three traits and markers on Chromosome 7 with covariates unadjusted.

Heping Zhang (C<sup>2</sup>S<sup>2</sup>, Yale University)

DIMACS 39 / 50

#### Results

P-values between the three traits and markers on Chromosome 7 with covariates adjusted or not.

• References

< ∃ >

- Developed a nonparametric weighted test to adjust for covariates that accommodates multiple traits
- Provided its asymptotic distribution and analytical power calculation
- Refined the weighted test by proposing the idea of maximum weighting over the grid points of parameters
- Proposed an asymptotic approach to assessing its significance

# Comorbidity: Definition and Mechanisms ۲ Generalized Kendall's Tau Maximum Weighted Test over Grids WTCCC Bipolar Disorder Data COGA Family Data Conclusions and Acknowledgment Method Data Analysis ۲ Acknowledgment

< ∃ ►

- WTCCC bipolar disorder data: not only confirmed the results reported by the WTCCC (2007), but also identified another region at the genome-wide significance level
- The identified haplotype block is near the RPGRIP1L gene that was reported to be associated with bipolar disorder (O'Donovan et al., 2008; Riley et al., 2009)
- COGA data: confirmed and strengthened the top signal; provided evidences for the advantage of maximum weighted test over non-weighted test
