LSS - 4 VOICES @ STREAMING 12KB/S AUDIO  
GALOIS

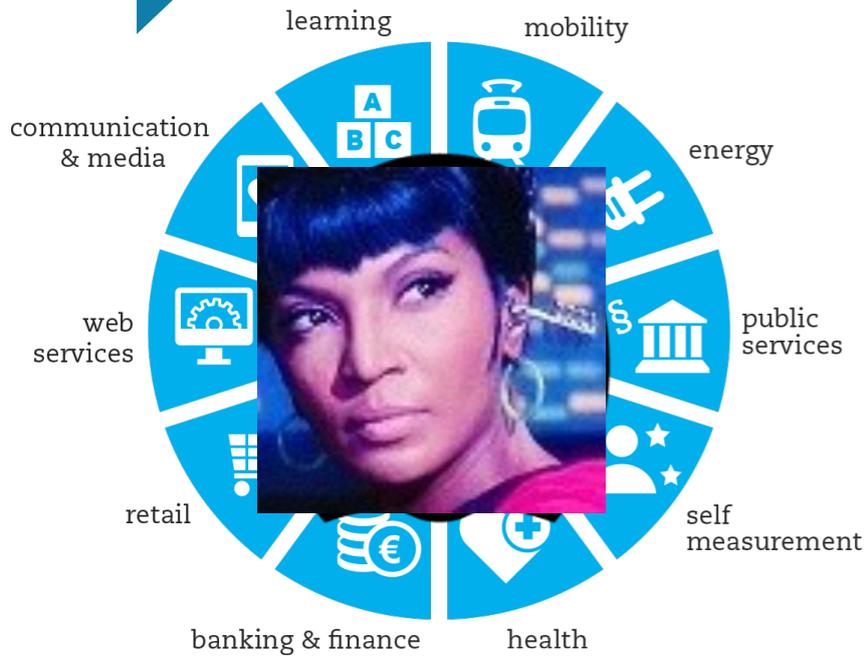

Problem: variable sample count  
in each fixed input window

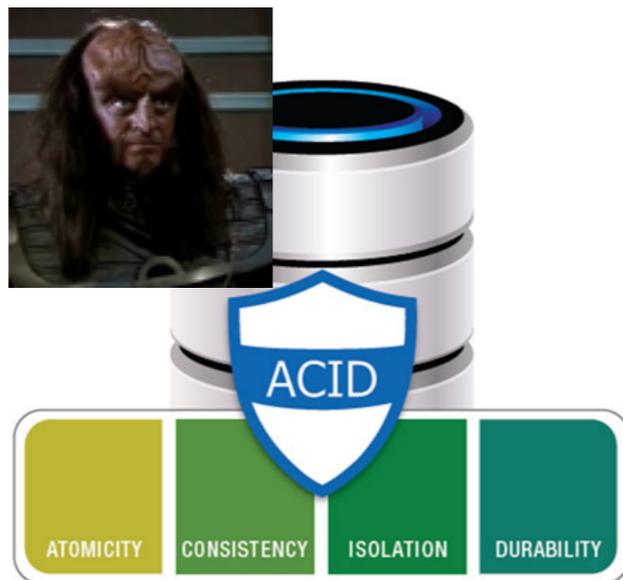

Solution: "Help out" the cryptographic solution:  
Impose external control loop and persistent state  
Error-prone, awkward and complicated

# PDaaS

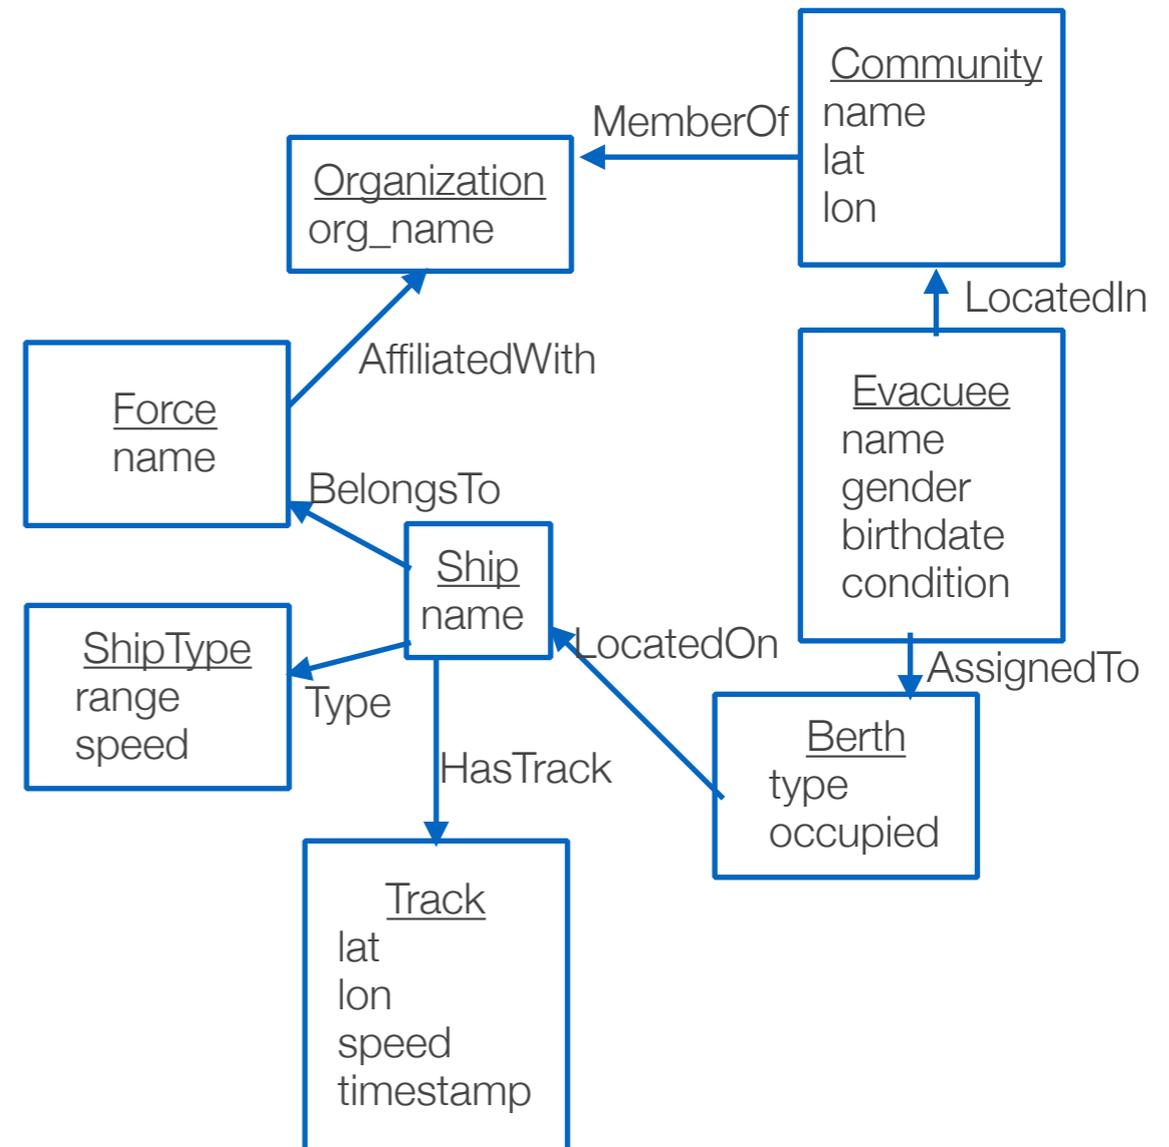

- only by people I authorize
- only under conditions I allow
- never for evil, and
- only when documented transparently

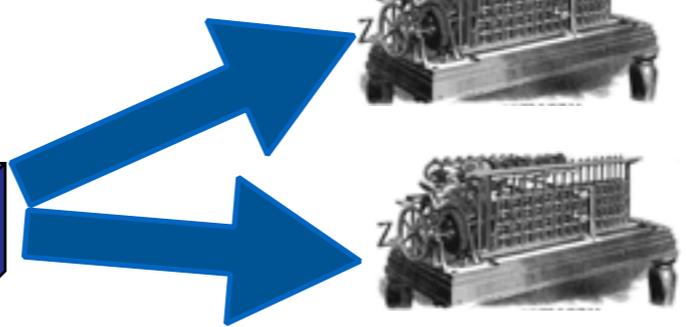

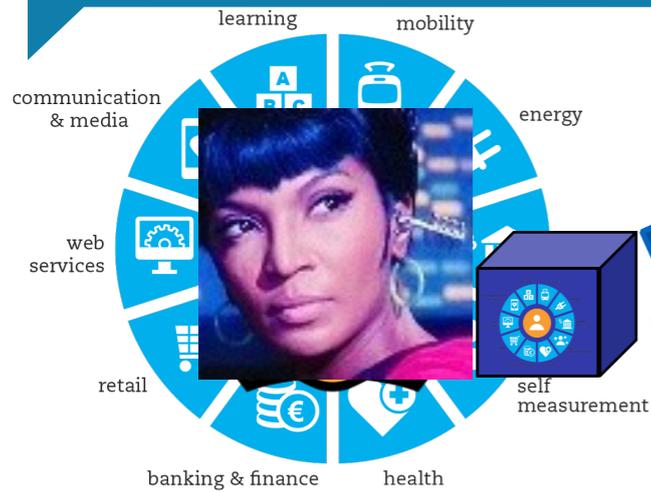

# A Sample Use Case

13

```
SELECT
  ship_name,
  stype AS ship_type,
  count(*) AS Number_Of_Berths,
  distance/speed AS eta
FROM ship
  JOIN track ON ship.id = track.ship_id
  JOIN shiptype ON ship.shiptype_id = shiptype.id
  JOIN hasberth ON ship.id = hasberth.ship_id
  JOIN berth ON berth.id = hasberth.berth_id,
  community
WHERE (community.community_name = 'Bajor') AND (occupied = FALSE) AND (ship_time = 25)
GROUP BY ship_name, stype, ship_lat, ship_lon, community_lat, community_lon, cruisingspeed
ORDER BY eta;
```

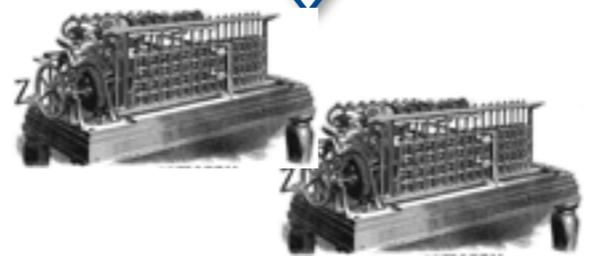

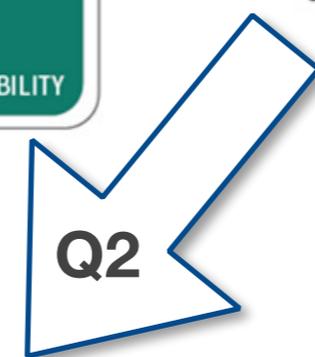

# Jana

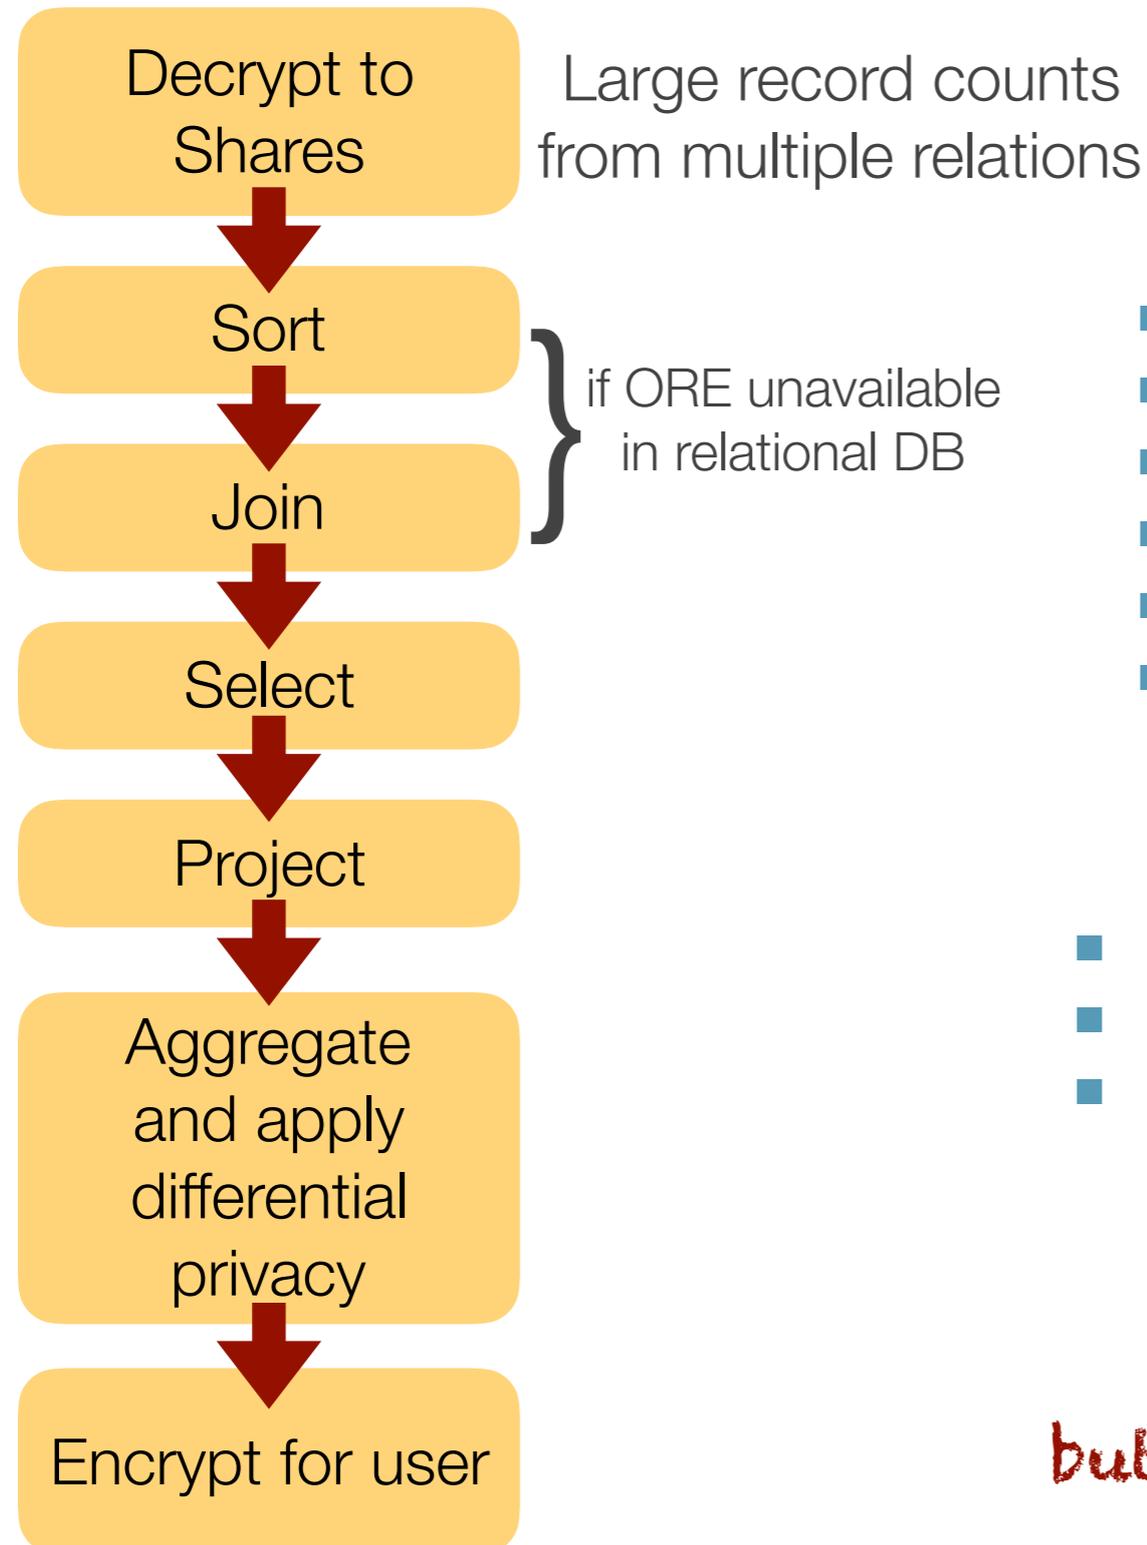

*Faster would be better...*

**SPJU SQL**  
no recursion  
no nested...yet

## SPDZ “plaintext RAM” computation model

- Arbitrary RAM computation (registers and heap)
- Does not hide access pattern (does it matter?)
- Memory statically allocated at compile-time
- Unbounded updates to registers and heap
- Direct/ indirect heap access, direct register access
- Unbounded re-use and update during program

- Reactive: inputs and program based on prior outputs
- Sub-linear access - not all data need be touched
- Loops need not be unrolled — reduced program size

*A bit racy (in leakage),  
but simpler than unrolling circuits*

# Simple-minded Conclusions

16

- RAM model often appears useful in “real-world” computations
  - Dynamic iteration count in loops
  - Sub-linear access cost for data
  - Reactive computation during run-time
- ORAM model may be too rich in security, too slow in practice
- Circuit model impractical for realistic data sizes, dynamic computation
